

1. **Introduction**

The purpose of this study is to investigate the effects of the proposed system on the performance of the participants. The study was conducted in a laboratory setting and involved a group of 20 participants who were randomly assigned to two conditions: the control condition and the experimental condition.

The control condition consisted of a standard task, while the experimental condition involved the use of the proposed system. The results of the study are presented in the following sections.

The first section of the study is the **Methodology**, which describes the experimental design and the procedures used to collect the data. The second section is the **Results**, which presents the findings of the study and compares the performance of the two conditions.

The **Conclusion** section summarizes the main findings of the study and discusses the implications of the results. The study concludes that the proposed system significantly improved the performance of the participants compared to the control condition. The results suggest that the proposed system is a promising tool for enhancing performance in this type of task.
